Dramatic Cycles of Human History

Every 50 years, a new Kondratieff wave emerges...wikipedia.org/wiki/Kondratiev_wave

Cognition defines understanding

GoodReason – Geometry of Thinking

History of GoodReason started from understanding programs to understanding the world:

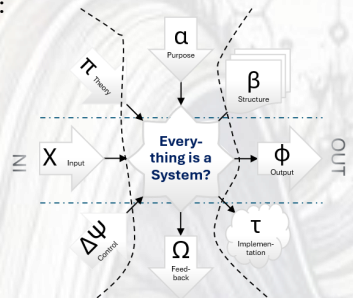

- PhD on Program comprehension by symbolic analysis
 - Atomistic, multi-lingual, object oriented simulation tool with knowledge capture
 - Movement to systems comprehension took 10 years

This novel cognitive multi-paradigm architecture approach:

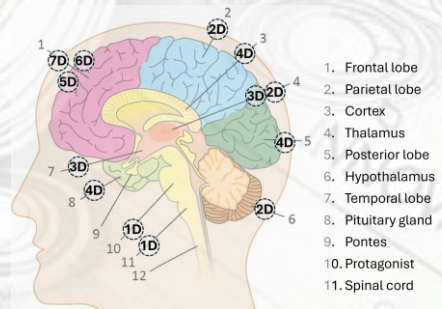

- Human understandable
- Machine-readable
- AI- and system-native (without programming)
- Universal model
- Intelligent semantics (symbols) ultra fast to use

Geometry of thinking allows conceptual spaces

- A) Horizontal level for thinking inside spaces:
 - $\langle \text{symbol} \rangle ::= \alpha \mid \pi \mid \chi \mid \Delta\psi \mid \beta \mid \phi \mid \tau \mid \Omega$
- B) Vertical approach to combine spaces
 - Dimensions grounded into cognitive science and IT: 1D to 8D (look Table below).
- C) Free: Tacit knowledge or external information as APIs

xD	Cognitive interpretation	Systemic interpretation
1D	attention, interest, salience	New target: SOI
2D	orientation, direction of meaning	framing and perspective: MOI
3D	awareness, sensitivity	depth of MOI in current sector
4D	Symbolic paradigm, language, representation	symbols take conceptual forms to carry information
5D	Dialogue, interpretation, interaction	Conversation theory, perspectives and actors meet
6D	Holism, holarchy, perception	Systemic paradigm, articulating systems
7D	Worldview and wisdom	science, resilience and education
8D	axiomatic thinking	solid base for arguing

The vertical dimension.

When Geometry of Thinking becomes explicit, its structures can be shared, tested and developed further. SuperJSON is introduced as a leverage model for this transition.

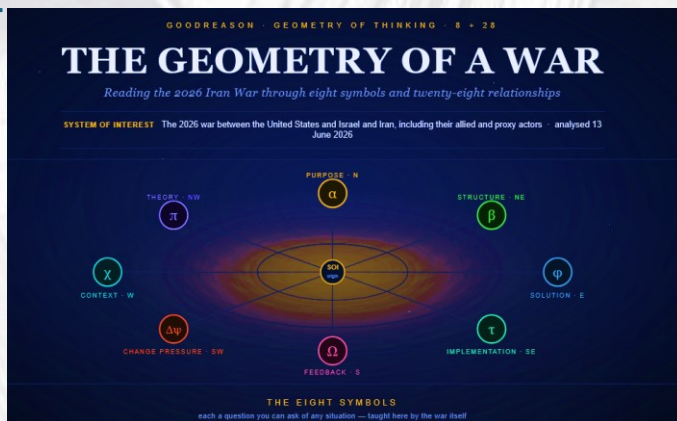

Bridge to new technologies and science through cognition !

Technology extends all frontiers

System – native formulation of GoodReason

- Keysymbols to master: Mindset α , Theory π , Information χ , Change pressure $\Delta\Psi$, Agency / organization β , Design ϕ , Implementation τ and Feedback Ω
- AI-native and system-native mean that no external programming is needed.
- SuperJSON provides a **common home grammar**, where different domains can express their systemic structures in a comparable form, with multi-agent-systems.

Level of $\alpha - \Omega$	Example: How to use	Benefits, added value
1 Annotation	"This is π 4 class theory."	Fast human orientation, arguementing
2 Diagram	Polar $\alpha - \Omega$ coordinates	Visual comparison, isomorphism
3 Prompt	AI query guided by symbols	Controlled resolution of AI process
4 Schema	SuperJSON structure	Semantics of universal thinking
5 Unification	Axiom: $(S, C, J) \rightarrow R$	Systemic knowledge to create agents

AI Analysis

- 1D (picture)
- 2D (NxN)
- 3D (cube)
- 4D (2Dx2D)
- Relationmatrix
- Pathologies
- Synergies
- Conflicts

The Iran War specialization demonstrates how a *turbulent conflict* can be expressed as a systemic field of purposes α , structures, pressures, theories, information gaps, implementation frictions, solution paths and feedback loops Ω . This is not prediction, but it is a **technological way** to expose where **futures** may branch, collapse or reorganize.

System: the 5th Category of Science

When Kant's four main categories shaped scientific thought for more than 200 years, a new foundation is needed for today's research in our complex, AI-mediated and interdependent society.

The concept *System* has potential to reform science from its current fragmented state because it emphasizes holism and coherence, is universal (von Bertalanffy) and is a very intensively and widely used word, but still a poorly understood artifact.

Ignorance can be corrected through education and good examples. As a result, the level of civilization of humanity may significantly increase.

As a proof, one of the most coherent theories, Hitchens' Unified System Hypothesis (USH) is compatible with GoodReason's $\alpha - \Omega$ – semantics. purpose of his model (1993) means α his equilibrium means π his environment means X his variety & control means $\Delta\psi$ his dominance & structure means β his limited variety & solution means ϕ his implementation equals τ his cyclic progression means feedback Ω

Unification between 2 unification hypotheses

Interdisciplinary research, metascience, societal ills, information asymmetry, international crises, and depletion of natural resources require a higher level of education and a systemic approach that the current system has not been able to provide.

Therefore, science must be reformed.

<https://goodreason.fi>

The **system** is the most powerful known candidate for a unifying foundation of knowledge, knowledge, because it can include structure, process, information, meaning, agency, feedback, and development within a single conceptual category.
